TITLE

## FUNGICIDAL PYRIMIDINONES

BACKGROUND OF THE INVENTION

This invention relates to certain pyrimidinones, their *N*-oxides, agriculturally suitable salts and compositions, and methods of their use as fungicides.

The control of plant diseases caused by fungal plant pathogens is extremely important in achieving high crop efficiency. Plant disease damage to ornamental, vegetable, field, cereal, and fruit crops can cause significant reduction in productivity and thereby result in increased costs to the consumer. Many products are commercially available for these purposes, but the need continues for new compounds which are more effective, less costly, less toxic, environmentally safer or have different modes of action.

DT 2,210,503, DT 2,411,274, DT 2,411,273, and DD-A-240,892 disclose certain thienopyrimidine compounds. These publications, however, do not disclose the compounds of the present invention nor agricultural fungicide utility. U.S. 3,755,582 and U.S. 3,867,384 disclose certain 4(3*H*)-quinazolinone fungicides. These publications, however, do not disclose the compounds of the present invention.

"Cycloalkyl" includes, for example, cyclopropyl, cyclobutyl, cyclopentyl, and cyclohexyl. Examples of "cycloalkylalkyl" include cyclopropylmethyl, cyclopentylethyl, and other cycloalkyl moieties bonded to straight-chain or branched alkyl groups. One skilled in the art will appreciate that not all nitrogen containing heterocycles can form *N*-oxides since the nitrogen requires an available lone pair for oxidation to the oxide; one skilled in the art will recognize those nitrogen containing heterocycles which can form *N*-oxides. One skilled in the art will also recognize that the *N*-oxides of compounds of Formula I can be made by oxidizing the corresponding nitrogen compound with a strong oxidizing agent such as *meta*-chloroperoxybenzoic acid.

The term "halogen", either alone or in compound words such as "haloalkyl", includes fluorine, chlorine, bromine or iodine. Further, when used in compound words such as "haloalkyl", said alkyl may be partially or fully substituted with halogen atoms which may be the same or different. Examples of "haloalkyl" include  $\text{F}_3\text{C}$ ,  $\text{ClCH}_2$ ,  $\text{CF}_3\text{CH}_2$  and  $\text{CF}_3\text{CCl}_2$ . The terms "haloalkenyl", "haloalkynyl", "haloalkoxy", and the

like, are defined analogously to the term "haloalkyl". Examples of "haloalkenyl" include  $(\text{Cl})_2\text{C}=\text{CHCH}_2$  and  $\text{CF}_3\text{CH}_2\text{CH}=\text{CHCH}_2$ . Examples of "haloalkynyl" include  $\text{HC}\equiv\text{CCHCl}$ ,  $\text{CF}_3\text{C}\equiv\text{C}$ ,  $\text{CCl}_3\text{C}\equiv\text{C}$  and  $\text{FCH}_2\text{C}\equiv\text{CCH}_2$ . Examples of "haloalkoxy" include  $\text{CF}_3\text{O}$ ,  $\text{CCl}_3\text{CH}_2\text{O}$ ,  $\text{HCF}_2\text{CH}_2\text{CH}_2\text{O}$  and  $\text{CF}_3\text{CH}_2\text{O}$ . Examples of "haloalkylthio" include  $\text{CCl}_3\text{S}$ ,  $\text{CF}_3\text{S}$ ,  $\text{CCl}_3\text{CH}_2\text{S}$  and  $\text{ClCH}_2\text{CH}_2\text{CH}_2\text{S}$ .

The total number of carbon atoms in a substituent group is indicated by the " $\text{C}_i\text{-C}_j$ " prefix where  $i$  and  $j$  are numbers from 1 to 10. For example,  $\text{C}_1\text{-C}_3$  alkylsulfonyl designates methylsulfonyl through propylsulfonyl;  $\text{C}_2$  alkoxyalkyl designates  $\text{CH}_3\text{OCH}_2$ ;  $\text{C}_3$  alkoxyalkyl designates, for example,  $\text{CH}_3\text{CH}(\text{OCH}_3)$ ,  $\text{CH}_3\text{OCH}_2\text{CH}_2$  or  $\text{CH}_3\text{CH}_2\text{OCH}_2$ ; and  $\text{C}_4$  alkoxyalkyl designates the various isomers of an alkyl group substituted with an alkoxy group containing a total of four carbon atoms, examples including  $\text{CH}_3\text{CH}_2\text{CH}_2\text{OCH}_2$  and  $\text{CH}_3\text{CH}_2\text{OCH}_2\text{CH}_2$ . In the above recitations, when a compound of Formula I is comprised of one or more heterocyclic rings, all substituents are attached to these rings through any available carbon or nitrogen by replacement of a hydrogen on said carbon or nitrogen.

Exemplary values of a 8-, 9- or 10-membered fused carbobicyclic or fused heterobicyclic ring, and a 3-, 4-, 5- or 6-membered heteromonocyclic ring wherein said heterobicyclic or heteromonocyclic rings contain 1 to 4 heteroatoms independently selected from the group nitrogen, oxygen and sulfur, provided that each heterobicyclic or heteromonocyclic ring contains no more than 4 nitrogens, no more than 2 oxygens and no more than 2 sulfurs, include the ring systems illustrated in Exhibit 1. As with the carbon atoms in the ring, the nitrogen atoms which require substitution to fill their valence are substituted with hydrogen or with  $\text{R}^8$ ,  $\text{R}^9$  or  $\text{R}^{10}$ . In the bicyclic ring systems (e.g., Y-66 – Y-90), the  $\text{R}^8$ ,  $\text{R}^9$  and  $\text{R}^{10}$  groups may substitute either ring. Although the  $\text{R}^8$ ,  $\text{R}^9$  and/or  $\text{R}^{10}$  groups are shown in the structures Y-1 to Y-100, it is noted that they do not need to be present since they are optional substituents.

#### Exhibit 1

When a group contains a substituent which can be hydrogen, for example  $R^3$  or  $R^7$ , then, when this substituent is taken as hydrogen, it is recognized that this is equivalent to said group being unsubstituted.

5        Compounds of this invention can exist as one or more stereoisomers. The various stereoisomers include enantiomers, diastereomers, atropisomers and geometric isomers. One skilled in the art will appreciate that one stereoisomer may be more active and/or may exhibit beneficial effects when enriched relative to the other stereoisomer(s) or when separated from the other stereoisomer(s). Additionally, the skilled artisan knows how to  
10       separate, enrich, and/or to selectively prepare said stereoisomers. Accordingly, the present invention comprises compounds selected from Formula I, *N*-oxides and agriculturally suitable salts thereof. The compounds of the invention may be present as a mixture of stereoisomers, individual stereoisomers, or as an optically active form.

15       The salts of the compounds of the invention include acid-addition salts with inorganic or organic acids such as hydrobromic, hydrochloric, nitric, phosphoric, sulfuric, acetic, butyric, fumaric, lactic, maleic, malonic, oxalic, propionic, salicylic, tartaric, 4-toluenesulfonic or valeric acids. The salts of the compounds of the invention also include those formed with organic bases (e.g., pyridine, ammonia, or triethylamine) or inorganic bases (e.g., hydrides, hydroxides, or carbonates of sodium, potassium,  
20       lithium, calcium, magnesium or barium) when the compound contains an acidic group.

Preferred compounds for reasons of better activity and/or ease of synthesis are:

The compounds of Formula I can be prepared by one or more of the following methods and variations as described in Schemes 1-17. The definitions of W, n, Q, G, R<sup>1</sup>-R<sup>13</sup> in the compounds of Formulae 1-6 below are as defined above in the Summary of the Invention. Compounds of Formulae Ia-It are various subsets of the compounds of Formula I, and all substituents for Formulae Ia-It are as defined above for Formula I.

The synthesis of compounds of Formula I is described below. First, the synthesis of the pyrimidinone ring system is described. In this first section, when  $R^1$  and/or  $R^2$  are  $R^{11}$ , the  $R^{11}$  substituent is incorporated into the substrates which are used in the syntheses described therein. Alternatively, the pyrimidinone ring system can be prepared using a precursor to the  $R^{11}$  group, and then the  $R^{11}$  group can be introduced afterwards. Syntheses of various  $R^{11}$  groups are described in the second section which describes this alternate strategy.

#### Synthesis of the Pyrimidinone Ring System

Compounds of Formula Ib, compounds of Formula I wherein W and Q are each O, can be made by the method illustrated in Scheme 1.

A 2-aminoaryl carboxylic acid of Formula 1 is condensed with an isothiocyanate of Formula  $R^1$ -NCS to form the 2-thiopyrimidinone of Formula 2. The condensation is preferably performed in the presence of a base such as triethylamine. S-Methylation of this compound affords the 2-methylthio-pyrimidinone of Formula Ia.

For the introduction of the  $R^2O$  group, the 2-methylthio bicyclic pyrimidinone of Formula Ia is treated with a mixture of a base, for example sodium hydride, in  $R^2OH$  solvent. The reaction mixture is stirred at a temperature from about 0 °C to 120 °C for 1 to 120 hours. The desired 2- $R^2O$  bicyclic pyrimidinone can be isolated from the reaction mixture by extraction into a water-immiscible solvent, and purified by chromatography or recrystallization. Synthetic procedures for the preparation of related 4(3H)-quinazolinones are described in U.S. 3,755,582 and incorporated herein by reference.

16

Scheme 1

2-Aminocarboxylic acids of Formula 1 are commercially available or can be prepared by known methods. For example, see *J. Heterocycl. Chem.*, (1966), 3, 252; *J. Org. Chem.*, (1952), 17, 547; *J. Org. Chem.*, (1949), 14, 97; *Synth. Commun.*, (1979), 9, 731. The isothiocyanates of Formula  $\text{R}^1\text{-NCS}$  can be prepared from the corresponding amine by treatment with thiophosgene as known in the art. For example, see *J. Heterocycl. Chem.*, (1990), 27, 407.

Alternatively, 2-thiopyrimidinediones of Formula 2 can be prepared by treatment of the ( $\text{C}_1\text{-C}_4$  alkyl) carboxylic acid ester of Formula 3 with thiophosgene to form the isothiocyanate ester, followed by treatment with an amine of formula  $\text{R}^1\text{NH}_2$  (Scheme 2).

17

Scheme 2

The ester of Formula 3 is treated with thiophosgene at a temperature from about -20 to 100 °C for 1 to 48 hours optionally in an inert solvent. Often this reaction is performed in a biphasic mixture in the presence of a base, such as calcium carbonate, and an acid, such as aqueous hydrochloric acid. The resulting isothiocyanate may be isolated by extraction into a water-immiscible solvent, such as methylene chloride, followed by drying of the organic extracts and evaporation under reduced pressure. Alternatively, the isothiocyanate can be combined in situ with the amine of Formula H<sub>2</sub>NR<sup>1</sup> and stirred at about -20 to 50 °C for 0.1 to 24 hours. The desired 2-thiopyrimidinedione of Formula 2 can be isolated from the reaction mixture by aqueous extraction, and purified by chromatography or recrystallization. Similar synthetic procedures are described in *J. Heterocycl. Chem.*, (1990), 27, 407.

Pyrimidinones of Formula Ic, compounds of Formula I wherein W is S and Q is O, can be prepared by a modification of the synthesis illustrated in Scheme 1. As illustrated in Scheme 3, the 2-thiopyrimidinedione of Formula 2 is alkylated with R<sup>2</sup>-X wherein X is a typical leaving group such as Br, I, CH<sub>3</sub>SO<sub>3</sub> (OMs), or (4-CH<sub>3</sub>-Ph)SO<sub>3</sub> (OTs) to afford the 2-R<sup>2</sup>S fused pyrimidinone of Formula Ic. One or more equivalents of a base can be used to accelerate the process. Bases such as sodium hydroxide and sodium hydride are suitable.

Scheme 3

Typically, the 2-thiopyrimidinedione is dissolved or dispersed in an inert solvent such as dimethylformamide and treated with a base at a temperature from about -20 to

60 °C. The reaction mixture may then be heated to just above ambient temperature to the reflux temperature of the solvent for 0.1 to 24 hours to effect deprotonation. The reaction mixture is cooled and treated with  $R^2-X$  and stirred for 0.1-24 hours at a temperature from about 20 °C to the reflux temperature of the solvent. The

- 5 pyrimidinone of Formula Ic can be isolated by extraction into a water-immiscible solvent, and purified by chromatography or recrystallization.

2-Thiopyrimidinones of Formula 2 are prepared as described above in Schemes 1 and 2.

- 10 Fused bicyclic pyrimidinones of Formula Id, compounds of Formula I wherein Q is O and W is  $S(O)$  or  $S(O)_2$ , can be prepared by oxidation of the corresponding  $-SR^2$  compound of Formula Ic using well-known procedures for oxidation of sulfur (Scheme 4). For example, see March, J. *Advanced Organic Chemistry*; 3rd ed., John Wiley: New York, (1985), p 1089.

Scheme 4

15

Fused bicyclic pyrimidinones of Formula Ie, compounds of Formula I wherein Q is O and W is  $NR^5$ , can be prepared by the method illustrated in Scheme 5. This method is described in detail in U.S. 3,867,384 and incorporated herein by reference.

20

Scheme 5

One method of preparation of compounds of Formula Ie is by treatment of a 2-methylthio pyrimidinone of Formula 4 (Z = SMe) with an excess of an amine of Formula  $\text{HNR}^5\text{R}^2$  at about 150 to 175 °C. A second method is to contact a 2-chloro-pyrimidinone of Formula 4 (Z = Cl) with one equivalent of  $\text{HNR}^5\text{R}^2$  and one equivalent of an acid scavenger, for example triethylamine, or with two equivalents of  $\text{HNR}^5\text{R}^2$ , at a temperature between 60 and 120 °C optionally in the presence of a solvent.

The preparation of compounds of pyrimidinones wherein Z is SMe is described above and in U.S. 3,755,582. The synthesis of pyrimidinones of Formula 4 wherein Z is Cl is described in U.S. 3,867,384. Amines of Formula  $\text{HNR}^5\text{R}^2$  are commercially available or can be prepared by well-known methods (March, J. *Advanced Organic Chemistry*; 3rd ed., John Wiley: New York, (1985), p 1153).

In addition to the methods described above, compounds of Formula Ib and Ic can be prepared by displacement of the 2-chlorine in the appropriate fused pyrimidinone, rather than by displacement of the 2-SCH<sub>3</sub> group (Scheme 1) or S-alkylation of the thiocarbonyl (Scheme 3).

In addition to the method described above, pyrimidinones of Formulae Ig and Ih, compounds of Formula I wherein  $\text{R}^5 = \text{C}(=\text{O})\text{R}^{12}$ , can be prepared by acylation of the corresponding  $\text{R}^5 = \text{H}$  compound of Formula If as illustrated in Scheme 6.

Scheme 6

The pyrimidinones of Formula If are treated with an acylating agent of Formula  $\text{R}^{12}\text{C}(=\text{O})\text{L}$  wherein L is an appropriate leaving group such as chlorine or  $\text{OC}(=\text{O})(\text{H or C}_1\text{-C}_4 \text{ alkyl})$ . In a similar fashion, compounds of Formula I wherein  $\text{R}^5$  is

-C(=O)NHR<sup>7</sup> (Formula Ih) can be prepared by condensing pyrimidinones of Formula If with isocyanates of Formula R<sup>7</sup>N=C=O using well known procedures.

Compounds of Formula Ij, compounds of Formula I wherein Q is S, can be prepared as illustrated in Scheme 7.

5

Scheme 7

Treatment of the fused pyrimidinone of Formula Ii with phosphorous pentasulfide or Lawesson's reagent [2,4-bis(4-methoxyphenyl)-1,3-dithia-2,4-diphosphetane-2,4-disulfide] in an inert solvent such as dioxane at a temperature from 0 °C to the reflux temperature of the solvent for 0.1 to 72 hours affords the pyrimidinethione of Formula Ij. This procedure is described in U.S. 3,755,582 and incorporated herein by reference.

For some compounds of Formula I, the R<sup>3</sup> and/or R<sup>4</sup> substituent is more conveniently introduced after cyclization to form the fused pyrimidinone. For example, the fused bromo-thiophene compound of Example 1 below was prepared by first synthesizing the fused pyrimidinone ring system, and then introducing the bromine substituent onto the thiophene ring. Other R<sup>3</sup> and R<sup>4</sup> substituents can be introduced onto the G ring in a similar fashion, or by displacement of a leaving group. For example, displacement of the bromine on the thiophene ring with the appropriate nucleophile can afford the corresponding R<sup>3</sup> = alkoxy, alkylthio, or NR<sup>6</sup>R<sup>7</sup> compound.

Salts of compounds of Formula I can be formed by treating the free base of the corresponding compound with strong acids such as hydrochloric or sulfuric acid. Salts can also be prepared by alkylation of a tertiary amine group in the molecule to form, for example, the trialkylammonium salt. N-Oxides of compounds of Formula I can be made by oxidizing the corresponding reduced nitrogen compound with a strong oxidizing agent such as *meta*-chloroperoxybenzoic acid.

#### Synthesis of R<sup>11</sup> Groups

As indicated above, compounds of Formula I can be prepared by incorporation of the R<sup>11</sup> group after the synthesis of the pyrimidinone ring system. A method for preparing the desired R<sup>11</sup> group is to form the carbocycle or heterocycle from the

pyrimidinone wherein  $R^1$  = alkenyl or alkynyl, or  $R^2$  = alkenyl or alkynyl. Methods for preparing carbocycles or heterocycles from alkenes and alkynes are well-known in the literature.

- 5 The method of incorporating  $R^{11}$  into the corresponding alkenyl compound is generically illustrated in Scheme 8. The first reaction illustrates the method for preparing  $R^1 = R^{11}$  compounds from the corresponding  $R^1$  = alkenyl compound. The second reaction illustrates how the same methodology can be used to prepare the  $R^2 = R^{11}$  compounds.

Scheme 8

10

The descriptions below refer to the preparation of the  $R^1 = R^{11}$  compounds, although one skilled in the art recognizes that the same procedures can be used to prepare the  $R^2 = R^{11}$  materials as well. The starting  $R^1$  or  $R^2$  alkenes are prepared by the methods described above and illustrated in Schemes 1-7.

### 15 3-Membered Ring Heterocycles

Compounds of Formula Ik, compounds of Formula I wherein  $R^1$  is  $R^{11}$  and  $R^{11}$  comprises an epoxide, can be prepared as illustrated in Scheme 9.

Scheme 9

Treatment of the alkene of Formula 4 with an oxidizing agent such as *m*-chloroperoxybenzoic acid (MCPBA) in an inert solvent such as methylene chloride affords the epoxide of Formula Ik as described by Schwartz, N., in *J. Org. Chem.*, (1964), 29, 1976.

Similarly, the aziridines of Formula II can be prepared from the alkenes of Formula 4 by condensation with a nitrene as illustrated in Scheme 10 and described in Abramovitch, R. *J. Chem. Soc., Chem. Commun.*, (1972), 1160.

Scheme 10

The NH aziridine compound of Formula Im can be prepared from the corresponding epoxide by contact with sodium azide and triphenylphosphine as illustrated below in Scheme 11 and described by Ittah, Y. in *J. Org. Chem.*, (1978), 43, 4271. The episulfide of Formula In can also be prepared from the epoxide using triphenylphosphine sulfide using techniques taught by Chan, T. in *J. Am. Chem. Soc.*, (1972), 94, 2880.

23

Scheme 11

In addition to the methods described above, methods for accessing compounds of Formulae Ik-In are taught in Calo, V., *J. Chem. Soc., Chem. Commun.*, (1975), 621;

- 5 Fujisawa, T., *Chem. Lett.*, (1972), 935; and March, J. *Advanced Organic Chemistry*, 3rd ed., John Wiley: New York, (1985), p 741.

4-Membered Ring Heterocycles

The synthesis of oxetanes of Formula Io may be achieved by ring expansion of the corresponding epoxide using dimethyloxosulfonium methylide as illustrated in

- 10 Scheme 12 and described by J. Okuma in *J. Org. Chem.*, (1983), 48, 5133. In some cases, a mixture of regioisomers will be obtained. Additional methods for preparing oxetanes, as well as other 4-membered ring heterocycles, from an alkene precursor are well-known in the art. For example, see: Buchi, G., *J. Am. Chem. Soc.*, (1954), 76, 4327; and Pifferi, G., *J. Heterocyclic Chem.*, (1967), 4, 619.

Scheme 12

5-Membered Ring Heterocycles

- Compounds of Formula I wherein R<sup>11</sup> comprises a 5-membered ring heterocycle can be obtained in a variety of ways. For example, dioxolane compounds can be prepared from the glycol using known methods. A method exemplifying the preparation of the dimethyl-dioxolane is illustrated in Scheme 13 and described by A. Hampton in *J. Am. Chem. Soc.*, (1961), 83, 3640.

Scheme 13

- Reaction of the glycol of Formula 5 with *p*-toluenesulfonic acid (TsOH) and 2,2-dimethoxypropane provides the desired material. The glycol of Formula 5 can be prepared from the alkene of Formula 4 using vicinal bis-hydroxylation reagents such as osmium tetroxide (see Wade, P., *Tetrahedron Lett.*, (1989), 5969).

- Some 5-membered ring compounds can be prepared from the alkene of Formula 4 using a 1,3-dipole cyclization. For example, reaction of 4 with bromonitrile oxide produces the dihydroisoxazole of Formula Iq as illustrated in Scheme 14 (see Wade, P., in *J. Org. Chem.*, (1990), 55, 3045).

Scheme 14

Cycloaddition of 1,3-dipoles with alkynes are also well-documented in the literature. For example, C. Kashima in *Heterocycles*, (1979), 12, 1343 teaches the

condensation of an alkyne with benzene nitrile oxide to form the isoxazole. A similar process to prepare the isoxazole of Formula Ir is illustrated in Scheme 15.

Scheme 15

5

Many 1,3-dipoles are known to react with alkenes and alkynes of Formulae 4 and 6, respectively, in cycloaddition reactions. Dipoles and methods for generating them are described in *1,3-Dipolar Cycloaddition Reactions*, A. Padwa, Ed., Wiley Interscience, NY, 1984, Vols. 1 and 2; and *Comprehensive Heterocyclic Chemistry*, Katritzky, A., Ed., Pergamon, NY, 1984, Vol. 5, p 143). Examples of known 1,3 dipoles are nitrile ylides, nitrile imines, nitrile sulfides, diazoalkanes, azides, azomethine ylides and nitrones.

One skilled in the art will recognize that the regiochemical outcome of the 1,3-dipolar addition will depend on the structures of both the 1,3-dipole and the dipolarophile. In many instances, a mixture of regioisomers will be obtained which can be separated by chromatography or recrystallization.

#### 6-Membered Ring Heterocycles

Compounds of Formula I wherein R<sup>11</sup> comprises a 6-membered ring heterocycle can be prepared from the alkene of Formula 4 by [4+2] cycloaddition with a suitable heterodiene. For example, conditions similar to those described by Krespan, C., in *J. Am. Chem. Soc.*, (1960), 82, 1515, can be employed to form dithianes of Formula Is as illustrated in Scheme 16.

20

26

Scheme 16

As with the aforementioned 1,3-dipolar cycloadditions, alkynes can also engage in reactions with heterodiene systems to afford unsaturated ring compounds such as those of Formula It.

Scheme 17

Ample literature exists citing various other heterodiene systems which are known to engage alkenes and alkynes of Formulae 4 and 6, respectively, to deliver 6-membered ring heterocyclic adducts. For example, see *Hetero Diels-Alder Methodology in Organic Synthesis*, Boger, D. and Weinreb, S., Eds., Academic, NY, (1987), pp 167-357; and *Contemporary Heterocyclic Chemistry*, Newkome, G. and Paudler, W., Wiley Interscience, NY, (1982), p 129. Examples of heterodienes known to undergo cycloaddition reactions are thiophene, furan,  $\alpha,\beta$ -unsaturated aldehydes and ketones,  $\alpha,\beta$ -unsaturated thiocarbonyl compounds,  $\alpha,\beta$ -unsaturated imines, vinyl nitroso species, azoalkenes, acyldiimides, acyl sulfenes, *o*-quinones, and thioamide-*N*-methylum salts.

Again, as in the previously mentioned case of 1,3-dipole cycloadditions, the regiochemical course of the [4+2] condensation depends on the structure of the alkene or alkyne and the heterodiene. Both regioisomers are often obtained in which case the desired regioisomer can be isolated by chromatography or recrystallization.

It is recognized that some reagents and reaction conditions described above for preparing compounds of Formula I may not be compatible with certain functionalities present in the intermediates. In these instances, the incorporation of protection/deprotection sequences or functional group interconversions into the synthesis will aid in obtaining the desired products. The use and choice of the protecting groups will be apparent to one skilled in chemical synthesis (see, for example, Greene, T. W.; Wuts, P. G. M. *Protective Groups in Organic Synthesis*, 2nd ed.; Wiley: New York, 1991). One skilled in the art will recognize that, in some cases, after the introduction of a given reagent as it is depicted in any individual scheme, it may be necessary to perform additional routine synthetic steps not described in detail to complete the synthesis of compounds of Formula I. One skilled in the art will also recognize that it may be necessary to perform a combination of the steps illustrated in the above schemes in an order other than that implied by the particular sequence presented to prepare the compounds of Formula I.

One skilled in the art will also recognize that compounds of Formula I and the intermediates described herein can be subjected to various electrophilic, nucleophilic, radical, organometallic, oxidation, and reduction reactions to add substituents or modify existing substituents.

Without further elaboration, it is believed that one skilled in the art using the preceding description can utilize the present invention to its fullest extent. The following Examples are, therefore, to be construed as merely illustrative, and not limiting of the disclosure in any way whatsoever. To a suspension of 150 mL of ethanol containing 9.5 g of methyl 3-amino-2-thiophenecarboxylate was added dropwise 9.3 mL of *n*-propyl isothiocyanate with stirring. To this reaction mixture was added 12.64 mL of triethylamine. The reaction mixture was heated at reflux for 3 h, allowed to cool to room temperature and then stirred for approximately 24 h. The mixture was then heated at reflux for an additional 32 h, cooled to approximately 5 °C and filtered to obtain 5.5 g of the title compound of Step A as an off-white solid melting at 246-249 °C.

Step B: Preparation of 2-(methylthio)-3-propylthieno[3,2-*d*]pyrimidin-4(3*H*)-one

To a mixture containing 3.6 g of the title compound of Step A suspended in 70 mL of 10% propanolic sodium hydroxide was added 1.46 mL of iodomethane with stirring. The mixture was stirred at room temperature for 1 h, then cooled to 0 °C and filtered to obtain an off-white solid. The off-white solid was purified by partially dissolving it in methylene chloride, filtering and evaporating the filtrate to obtain 3.13 g of the title compound of Step B as a white solid melting at 136-138 °C.

Step C: Preparation of 7-bromo-2-(methylthio)-3-propylthieno[3,2-*d*]pyrimidin-4(3*H*)-one

The mixture was allowed to warm to room temperature and stirred for 24 h. The reaction mixture was filtered to obtain 0.60 g of a white solid. The white solid was purified by column chromatography on silica gel eluting with hexane and then 8:1 hexane:ethyl acetate. Collection and evaporation of those fractions containing the least polar component (according to thin layer chromatography, 6:1 hexane:ethyl acetate mixture as the development solvent) yielded 0.12 g of the title compound of Step C, a compound of the invention, as a white solid melting at 146-147 °C. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ 1.02 (t,3H), 1.81 (m,2H), 2.71 (s,3H), 4.11 (t,2H), 7.69 (s,1H).

The resulting suspension was stirred at room temperature for 4.5 h. To this suspension was added 100 mL of water and 50 mL of ether. The insoluble solid was filtered-off to give 1.06 g of the title compound of Step B, a compound of the invention, as a yellow solid melting at 143-145 °C. The ether layer of the filtrate was separated and the aqueous layer was extracted with ethyl acetate (2 times with 50 mL). ### EXAMPLE 10

A 0.06 g portion of sodium hydride (60% active in oil, delivers 1.6 mmol NaH) was added to 8 mL of 3-pyridinylcarbinol at 0 °C and the resulting mixture was stirred at 0 °C for 15 min. Cooling was ceased and the mixture was then stirred at room temperature for 1 h followed by a brief period of gentle heating to ensure complete alkoxide formation. After cooling back to ambient temperature, 6-bromo-2-(methylthio)-3-propyl-4(3*H*)-quinazolinone (0.50 g, 1.6 mmol, prepared from *n*-propyl isothiocyanate via methods described in Example 6 with exception that triethylamine was omitted in Step A) was added all at once and the ensuing mixture was stirred at room temperature for 48 h. Subjection of this crude residue to column chromatography on silica gel (6:4 v/v hexane:ethyl acetate as eluant) provided three fractions of partially purified materials as oils after solvent removal. Treatment of the intermediate fraction with several milliliters of water with swirling resulted in formation of a precipitate. EXAMPLE 11Step A: Preparation of 3-(cyclopropylmethyl)-2,3-dihydro-6-iodo-2-thioxopyrido[2,3-*d*]pyrimidin-4(1*H*)-one

The resulting mixture was heated at 80 °C for 3 h, followed by stirring at ambient temperature overnight. A 2.5 g quantity of this material was combined with cyclopropyl methylisothiocyanate (0.88 g, 7.8 mmol) and triethylamine (25 g, 25.0 mmol) in dimethylformamide (20 mL) and heated to 110-120 °C for about 3 days. The reaction mixture was diluted with an equal volume of ethanol and filtered to afford a solid. The filtrate was refiltered to deliver a second crop of solid. The filtered precipitates so obtained were then combined and washed with additional ethanol, followed by hexane washing. After drying, 0.53 g of the title compound of Step A was obtained as a solid melting at >300 °C. <sup>1</sup>H-NMR (300 MHz, Me<sub>2</sub>SO-*d*<sub>6</sub>): δ 0.38-0.50 (m,4H), 1.30-1.47 (m,1H), 4.24-4.40 (d,2H), 8.58 (d,1H), 8.92 (s,1H), 13.50 (br s,1H).

Step B: Preparation of 3-(cyclopropylmethyl)-6-iodo-2-(propylthio)pyrido[2,3-*d*]pyrimidin-4(3*H*)-one

A mixture of the title compound of Step A (0.5 g, 1.39 mmol), *n*-propyl iodide (0.36 g, 2.09 mmol) and potassium carbonate (1.9 g, 13.9 mmol) in DMF (14 mL) were stirred at ambient temperature overnight. The reaction mixture was then concentrated to dryness *in vacuo* and the residue partitioned between 200 mL of ethyl acetate and 100 mL of H<sub>2</sub>O. The organic phase was separated, washed with saturated aqueous NaCl, dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated *in vacuo* to provide 0.5 g of crude product. Purification of this crude product was achieved via column chromatography (silica gel, 70:30 hexanes:ethyl acetate eluent) to deliver 0.19 g of the title compound of Step B, a compound of the invention, as a solid melting at 159-161 °C. <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>): δ 0.50-0.62 (m,4H), 1.10 (t,3H), 1.31-1.43 (m,1H), 1.79-1.94 (m,2H), 3.41 (t,2H), 4.10 (d,2H), 8.82 (s,1H), 9.02 (d,1H). Mass Spectrum: *m/e* 402 (protonated parent molecular ion measured by mass spectrometry using atmospheric pressure

chemical ionization in the positive ion mode (APCI<sup>+</sup>); the ion shown corresponds to the M+H<sup>+</sup> ion calculated from the integral values of the atomic weights of the most abundant isotope of each element present).

#### EXAMPLE 12

5    Step A:        Preparation of 2,3-dihydro-6,8-diiodo-3-[(tetrahydro-2-furanyl)methyl]-2-thioxo-4(1H)quinazolinone

A mixture of 2-amino-3,5-diiodobenzoic acid (1.09 g, 2.57 mmol), tetrahydrofurfuryl isothiocyanate (0.35 g, 2.43 mmol) and triethylamine (0.26 g, 2.57 mmol) in 3.5 mL of ethanol was heated to reflux for about 6 h, and then was  
10    allowed to cool to room temperature. The ensuing precipitate was filtered and washed with ethanol (1 x 20 mL), hexanes (1 x mL), and then dried to deliver 0.86 g of the title compound of Step A. <sup>1</sup>H NMR (400 MHz, Me<sub>2</sub>SO-*d*<sub>6</sub>): δ 1.64-1.75 (m,1H), 1.75-1.85 (m,1H), 1.86-2.0 (m,2H), 3.57-3.65 (m,1H), 3.70-3.81 (m,1H), 4.26-4.34 (m,1H), 4.36-4.44 (m,1H), 4.52-4.60 (m,1H), 8.19 (d,1H), 8.56 (d,1H), 10.1 (br s,1H).

15    Step B:        Preparation of 6,8-diiodo-2-(propylthio)-3-[(tetrahydro-2-furanyl)methyl]-4(3H)-quinazolinone

A mixture of the title compound of Step A (0.86 g, 1.67 mmol), *n*-propyl iodide (0.85 g, 5.02 mmol) and potassium carbonate (2.3 g, 16.7 mmol) was stirred in dimethylformamide (20 mL) at ambient temperature for approximately 4 h. The reaction  
20    mixture was then concentrated to dryness *in vacuo* and partitioned between 200 mL each of ethyl acetate and water. The organic phase was then separated, washed with saturated aqueous NaCl, and dried over Na<sub>2</sub>SO<sub>4</sub>. Concentration *in vacuo* provided 0.82 g of the title compound of Step B, a compound of the invention, as a solid melting at 108-111 °C. <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>): δ 1.10 (t,3H), 1.63-1.80 (m,1H),  
25    1.80-2.14 (m,5H), 3.24-3.45 (m,2H), 3.70-3.80 (m,1H), 3.90-4.00 (m,1H), 4.10-4.21 (m,2H), 4.35-4.47 (m,1H), 8.44 (d,1H), 8.48 (d,1H).

By the procedures described herein together with methods known in the art, the following compounds of Tables 1 to 12 can be prepared. The following abbreviations are used in the Tables which follow: *t* = tertiary, *s* = secondary, *n* = normal, *i* = iso,  
30    *c* = cyclo, Me = methyl, Et = ethyl, Pr = propyl, *i*-Pr = isopropyl, Bu = butyl, Ph = phenyl, MeO = methoxy, PhO = phenoxy, MeS = methylthio, CN = cyano, NO<sub>2</sub> = nitro, Me<sub>3</sub>Si and SiMe<sub>3</sub> = trimethylsilyl, Me<sub>2</sub>N = dimethylamino, EtNH = ethylamino, S(O)<sub>2</sub>Me = methylsulfonyl, and 2-THF = tetrahydro-2-furanyl.

The G groups in the Tables which follow are illustrated. The wavy line indicates  
35    that the G ring is fused to the pyrimidinone ring as illustrated below.

R<sup>11</sup> is defined in the Summary of the Invention as C<sub>1</sub>-C<sub>10</sub> alkyl substituted with a carbobicyclic, heterobicyclic or heteromonocyclic ring optionally substituted with R<sup>8</sup>, R<sup>9</sup> and R<sup>10</sup>. In Tables 1-4 below, R<sup>11</sup> is represented by an alkylene chain [e.g., (CH<sub>2</sub>)<sub>3</sub>], and the carbobicyclic, heterobicyclic or heteromonocyclic ring substituent is indicated by a Y-number corresponding to the Y groups illustrated in Exhibit 1 above.

Therefore, for example, the Table entry of R<sup>11</sup> = CH<sub>2</sub>(Y-2), R<sup>8</sup> = 3-OCF<sub>3</sub> represents:

The numbering system for the ring portion of R<sup>11</sup> is indicated in Exhibit 1. A dash ("-") indicates R<sup>8</sup>, R<sup>9</sup> and/or R<sup>10</sup> is not present. An unsubstituted ring (i.e., a ring bearing only hydrogens) has a "-" for R<sup>8</sup>, R<sup>9</sup> and R<sup>10</sup>.

#### Formulation/Utility

- 5 Compounds of this invention will generally be used as a formulation or composition with an agriculturally suitable carrier comprising at least one of a liquid diluent, a solid diluent or a surfactant. The formulation or composition ingredients are

selected to be consistent with the physical properties of the active ingredient, mode of application and environmental factors such as soil type, moisture and temperature. Useful formulations include liquids such as solutions (including emulsifiable concentrates), suspensions, emulsions (including microemulsions and/or suspoemulsions) and the like which optionally can be thickened into gels. Useful formulations further include solids such as dusts, powders, granules, pellets, tablets, films, and the like which can be water-dispersible ("wettable") or water-soluble. Active ingredient can be (micro)encapsulated and further formed into a suspension or solid formulation; alternatively the entire formulation of active ingredient can be encapsulated (or "overcoated"). Encapsulation can control or delay release of the active ingredient. Sprayable formulations can be extended in suitable media and used at spray volumes from about one to several hundred liters per hectare. High-strength compositions are primarily used as intermediates for further formulation.

The formulations will typically contain effective amounts of active ingredient, diluent and surfactant within the following approximate ranges which add up to 100 percent by weight.

	Weight Percent		
	<u>Active Ingredient</u>	<u>Diluent</u>	<u>Surfactant</u>
Water-Dispersible and Water-soluble Granules, Tablets and Powders.	5-90	0-94	1-15
Suspensions, Emulsions, Solutions (including Emulsifiable Concentrates)	5-50	40-95	0-15
Dusts	1-25	70-99	0-5
Granules and Pellets	0.01-99	5-99.99	0-15
High Strength Compositions	90-99	0-10	0-2

Typical solid diluents are described in Watkins, et al., *Handbook of Insecticide Dust Diluents and Carriers*, 2nd Ed., Dorland Books, Caldwell, New Jersey. Typical liquid diluents are described in Marsden, *Solvents Guide*, 2nd Ed., Interscience, New York, 1950. *McCutcheon's Detergents and Emulsifiers Annual*, Allured Publ. Corp., Ridgewood, New Jersey, as well as Sisely and Wood, *Encyclopedia of Surface Active Agents*, Chemical Publ. Co., Inc., New York, 1964, list surfactants and recommended uses. All formulations can contain minor amounts of additives to reduce foam, caking, corrosion, microbiological growth and the like, or thickeners to increase viscosity.

Surfactants include, for example, polyethoxylated alcohols, polyethoxylated alkylphenols, polyethoxylated sorbitan fatty acid esters, dialkyl sulfosuccinates, alkyl

sulfates, alkylbenzene sulfonates, organosilicones, *N,N*-dialkyltaurates, lignin sulfonates, naphthalene sulfonate formaldehyde condensates, polycarboxylates, and polyoxyethylene/polyoxypropylene block copolymers. Solid diluents include, for example, clays such as bentonite, montmorillonite, attapulgite and kaolin, starch, sugar, silica, talc, diatomaceous earth, urea, calcium carbonate, sodium carbonate and bicarbonate, and sodium sulfate. Liquid diluents include, for example, water, *N,N*-dimethylformamide, dimethyl sulfoxide, *N*-alkylpyrrolidone, ethylene glycol, polypropylene glycol, paraffins, alkylbenzenes, alkyl naphthalenes, oils of olive, castor, linseed, tung, sesame, corn, peanut, cotton-seed, soybean, rape-seed and coconut, fatty acid esters, ketones such as cyclohexanone, 2-heptanone, isophorone and 4-hydroxy-4-methyl-2-pentanone, and alcohols such as methanol, cyclohexanol, decanol and tetrahydrofurfuryl alcohol.

Solutions, including emulsifiable concentrates, can be prepared by simply mixing the ingredients. Dusts and powders can be prepared by blending and, usually, grinding as in a hammer mill or fluid-energy mill. Suspensions are usually prepared by wet-milling; see, for example, U.S. 3,060,084. Granules and pellets can be prepared by spraying the active material upon preformed granular carriers or by agglomeration techniques. See Browning, "Agglomeration", *Chemical Engineering*, December 4, 1967, pp 147-48, *Perry's Chemical Engineer's Handbook*, 4th Ed., McGraw-Hill, New York, 1963, pages 8-57 and following, and WO 91/13546. Pellets can be prepared as described in U.S. 4,172,714. Water-dispersible and water-soluble granules can be prepared as taught in U.S. 4,144,050, U.S. 3,920,442 and DE 3,246,493. Tablets can be prepared as taught in U.S. 5,180,587, U.S. 5,232,701 and U.S. 5,208,030. Films can be prepared as taught in GB 2,095,558 and U.S. 3,299,566.

For further information regarding the art of formulation, see U.S. 3,235,361, Col. 6, line 16 through Col. 7, line 19 and Examples 10-41; U.S. 3,309,192, Col. 5, line 43 through Col. 7, line 62 and Examples 8, 12, 15, 39, 41, 52, 53, 58, 132, 138-140, 162-164, 166, 167 and 169-182; U.S. 2,891,855, Col. 3, line 66 through Col. 5, line 17 and Examples 1-4; Klingman, *Weed Control as a Science*, John Wiley and Sons, Inc., New York, 1961, pp 81-96; and Hance et al., *Weed Control Handbook*, 8th Ed., Blackwell Scientific Publications, Oxford, 1989.

### BIOLOGICAL EXAMPLES OF THE INVENTION

Test compounds were first dissolved in acetone in an amount equal to 3% of the final volume and then suspended at a concentration of 200 ppm in purified water containing 250 ppm of the surfactant Trem® 014 (polyhydric alcohol esters). The resulting test suspensions were then used in the following tests. Spraying these 200 ppm test suspensions to the point of run-off on the test plants is the equivalent of a rate of 500 g/ha.

#### TEST A

The test suspension was sprayed to the point of run-off on wheat seedlings. The following day the seedlings were inoculated with a spore dust of *Erysiphe graminis* f. sp. *tritici*, (the causal agent of wheat powdery mildew) and incubated in a growth chamber at 20°C for 7 days, after which disease ratings were made.

#### TEST B

The test suspension was sprayed to the point of run-off on wheat seedlings. The following day the seedlings were inoculated with a spore suspension of *Puccinia recondita* (the causal agent of wheat leaf rust) and incubated in a saturated atmosphere at 20°C for 24 h, and then moved to a growth chamber at 20°C for 6 days, after which disease ratings were made.

#### TEST C

The test suspension was sprayed to the point of run-off on tomato seedlings. The following day the seedlings were inoculated with a spore suspension of *Phytophthora infestans* (the causal agent of potato and tomato late blight) and incubated in a saturated atmosphere at 20°C for 24 h, and then moved to a growth chamber at 20°C for 5 days, after which disease ratings were made.

#### TEST D

The test suspension was sprayed to the point of run-off on grape seedlings. The following day the seedlings were inoculated with a spore suspension of *Plasmopara viticola* (the causal agent of grape downy mildew) and incubated in a saturated atmosphere at 20°C for 24 h, moved to a growth chamber at 20°C for 6 days, and then incubated in a saturated atmosphere at 20°C for 24 h, after which disease ratings were made.

#### TEST E

The test suspension was sprayed to the point of run-off on cucumber seedlings. The following day the seedlings were inoculated with a spore suspension of *Botrytis cinerea* (the causal agent of gray mold on many crops) and incubated in a saturated

atmosphere at 20°C for 48 h, and moved to a growth chamber at 20°C for 5 days, after which disease ratings were made.

#### TEST F

The test suspension was sprayed to the point of run-off on cucumber seedlings.

- 5 The following day the seedlings were inoculated with a spore suspension of *Erysiphe cichoracearum* (the causal agent of cucumber powdery mildew) and moved to a greenhouse for 7 days. Disease ratings were made 7 days following application of the test compounds.

- 10 Results for Tests A-F are given in Table A. In the table, a rating of 100 indicates 100% disease control and a rating of 0 indicates no disease control (relative to the controls). A dash (-) indicates no test results.
